- Conclusions and next steps

AUTOSAR (**AUT**omotive **O**pen **S**ystem **AR**chitecture) is an open and standardized automotive software architecture, jointly developed by automobile manufacturers, suppliers and tool developers.

Key features

- **Exchangeability** and **Integration** of functions between car makers and ECU suppliers
- **Increased scope** of automatic code generation and configuration
- **Implementation** and **standardization** of SW architecture and basic functions
- Increased use of Commercial **Off-the-shelf** Hardware

AUTOSAR provides a common software infrastructure for automotive systems based on a

- **standardized architecture**
- **application interfaces**
- **defined methodology**

AUTOSAR requires a **complete, exact definition** of the entire SW Architecture, including :

- Hundreds of SW Components
- Thousands of ports and interfaces
- Hundreds of data types, ranges, scalings
- Complete interconnection of SW Components
- Configuration of Real-Time Operating System
- Configuration of the Basic SW

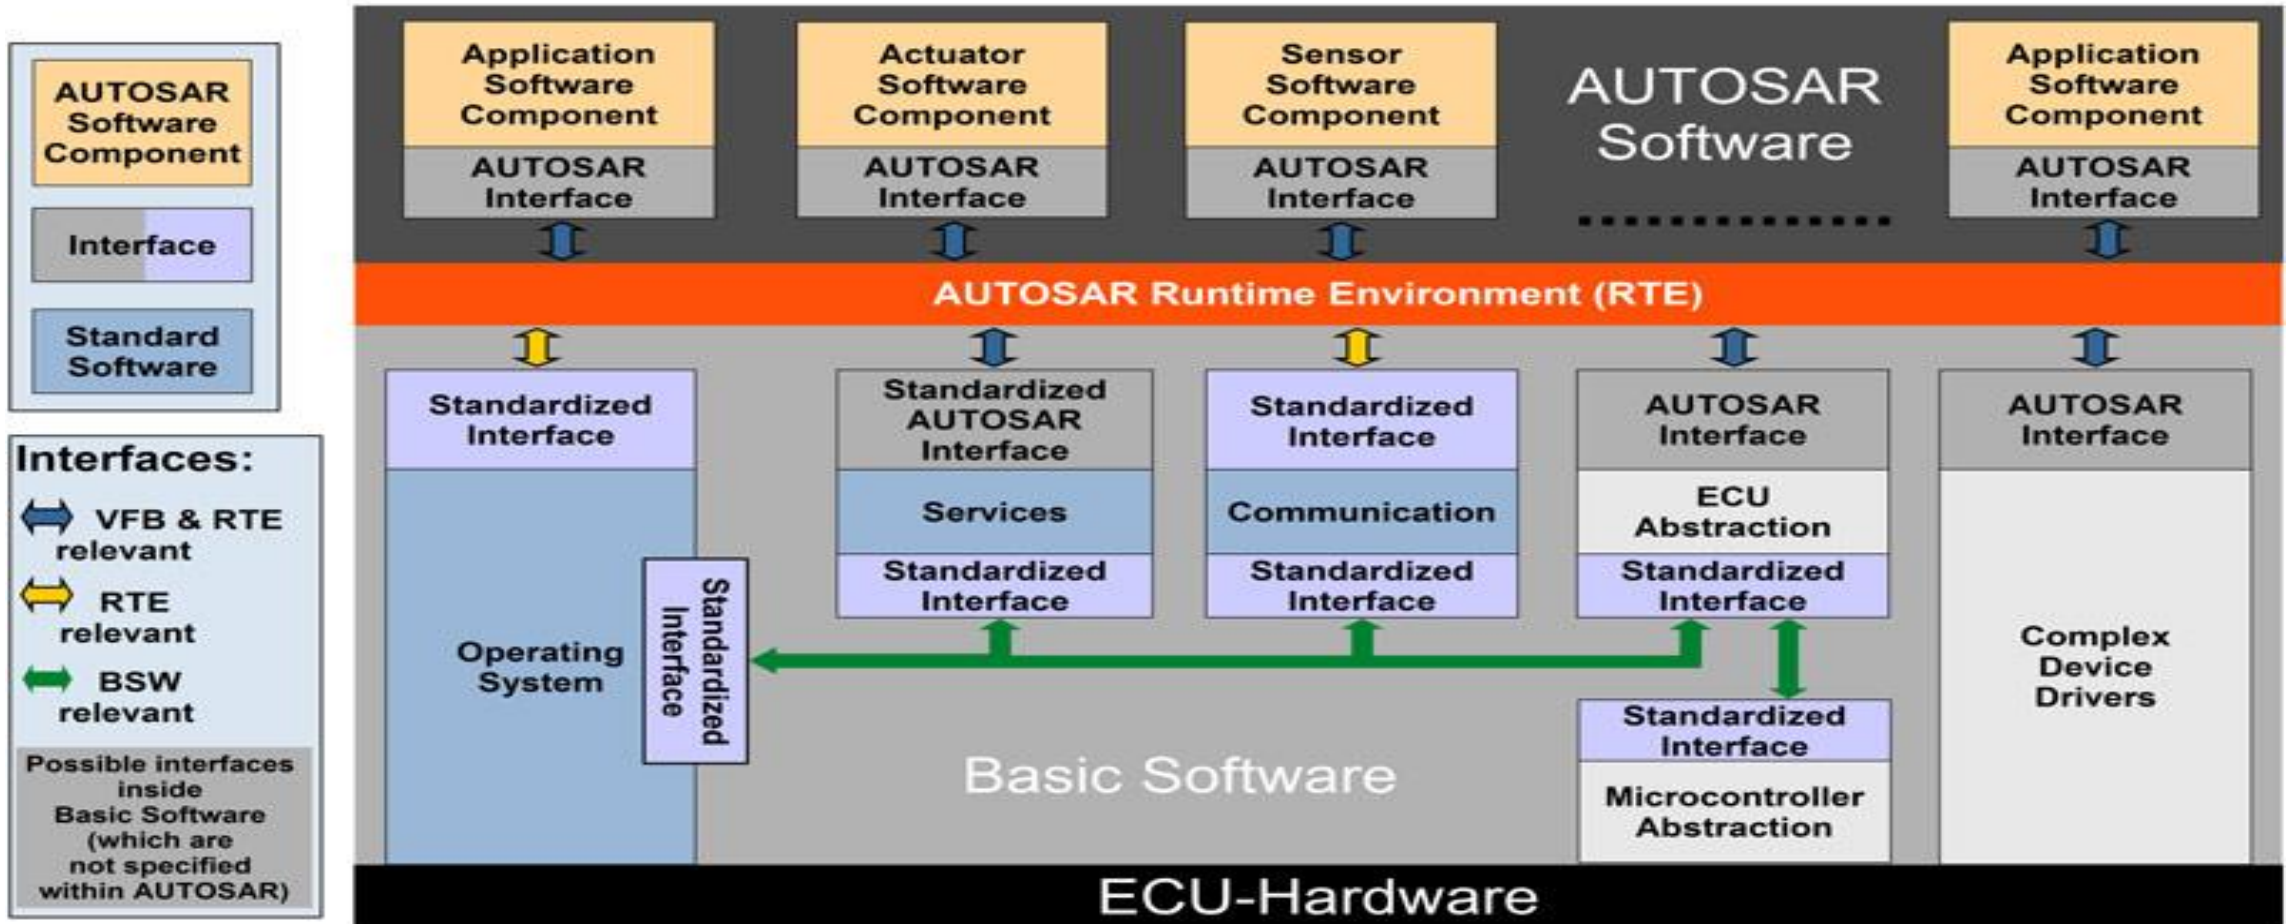

It's a **tool-driven approach** :

- Architecture Authoring Tools
- Configuration Tools
- Code Generation Tools

Interfaces

Components and interfaces view (simplified)

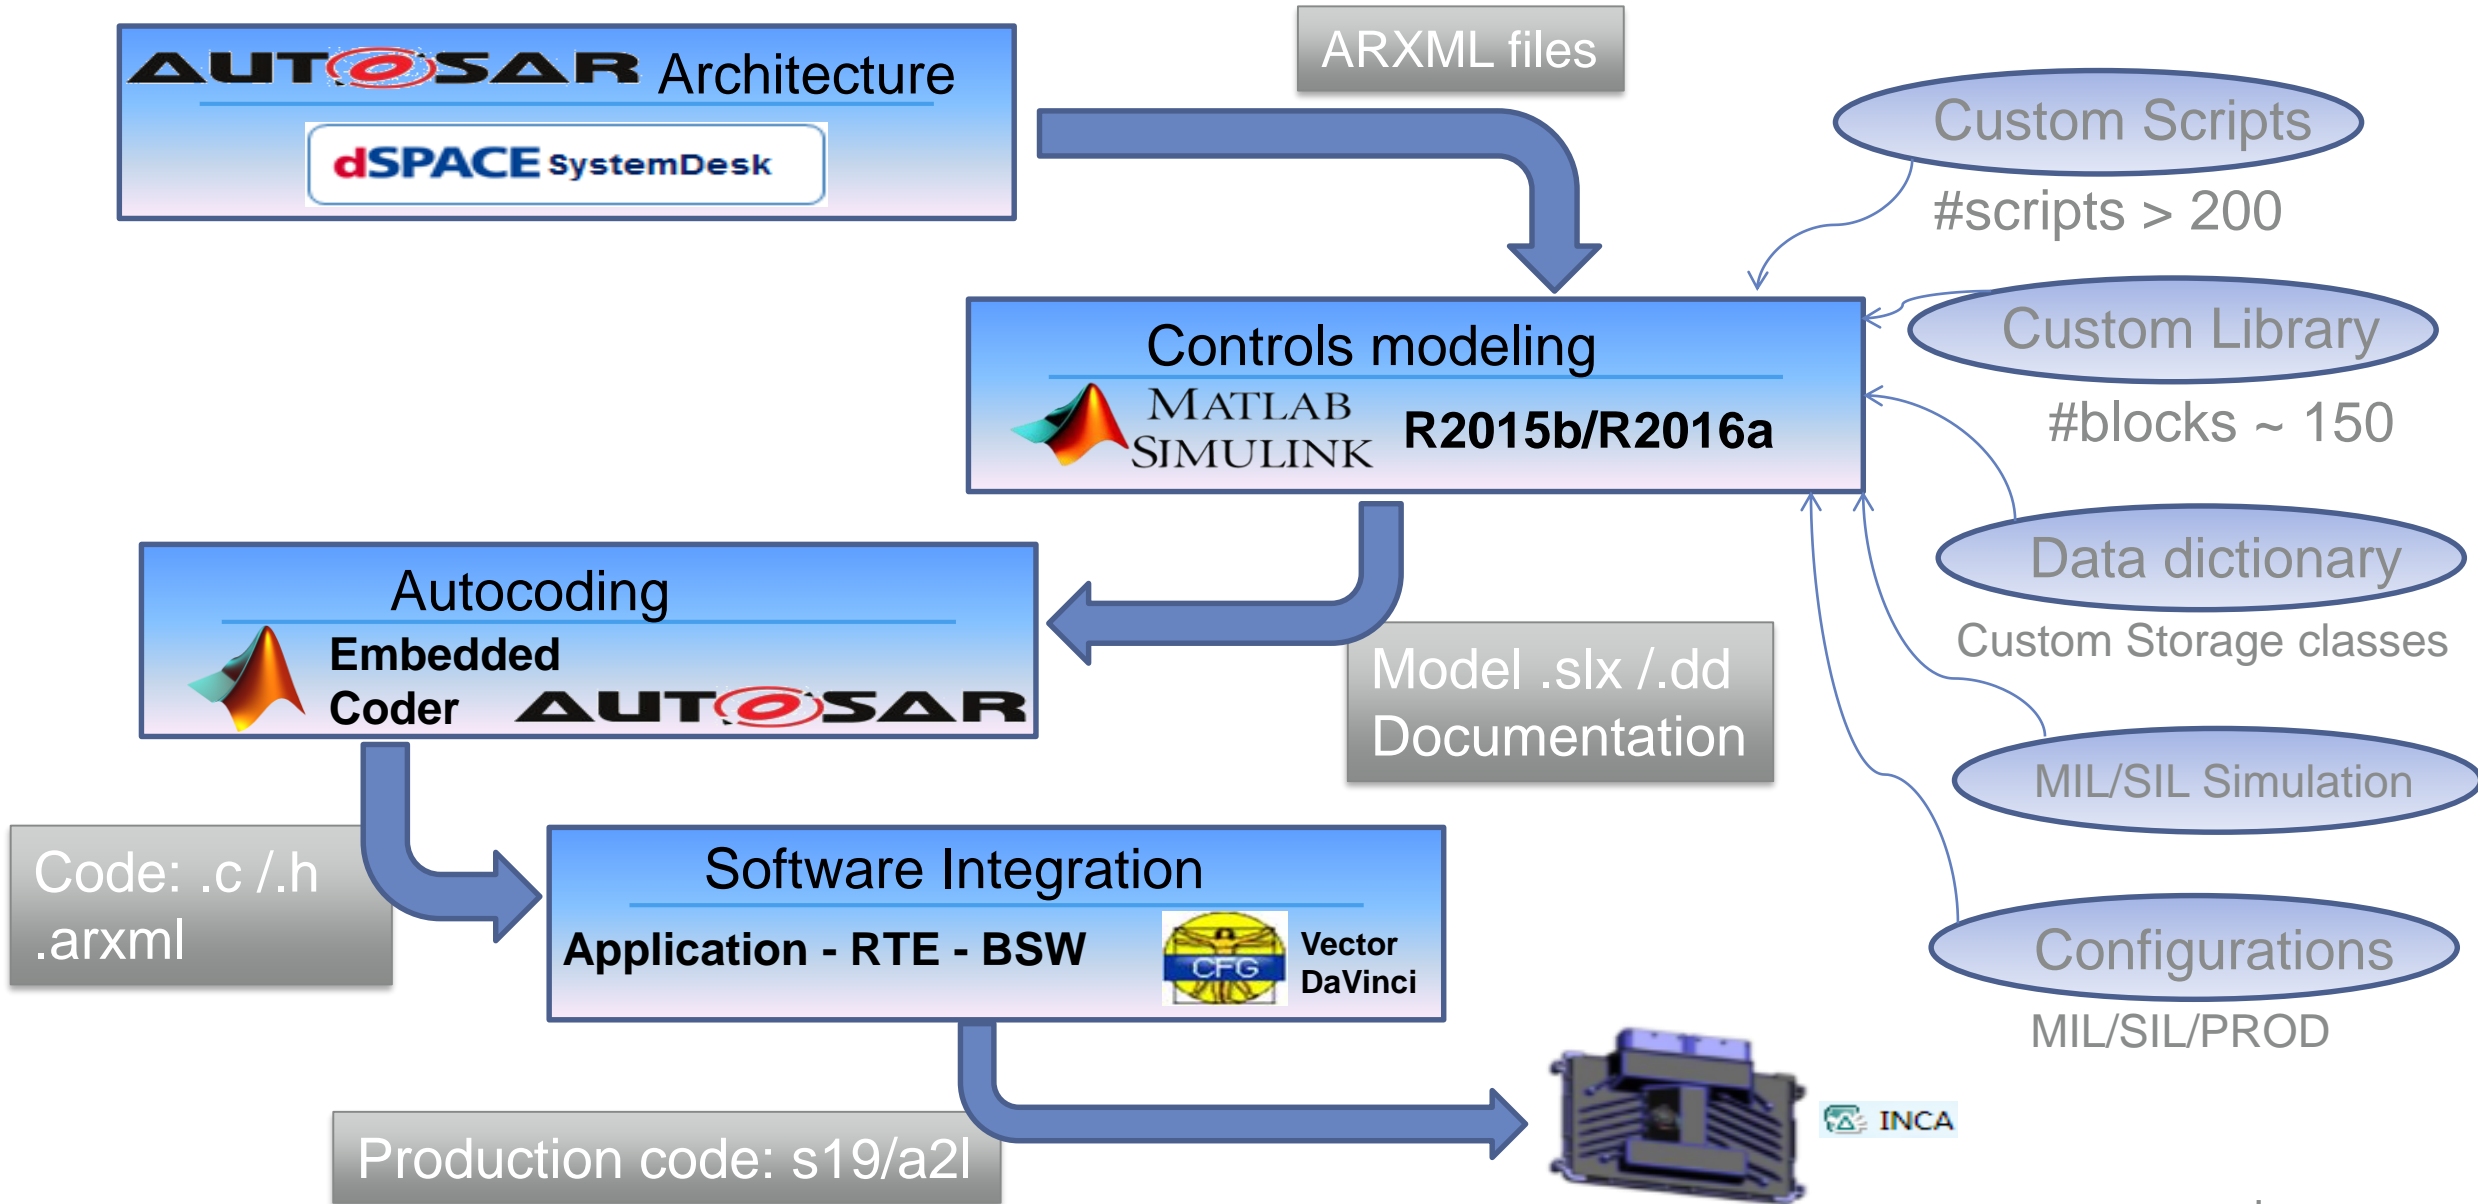

AUTOSAR is a (complex!) methodology to **handle complexity**.

Some **advantages** for FCA PWT :

- It provides a formal language to design complex SW systems that can be **shared** and **understood across distributed teams** (using the proper tools)
- It requires to define the SW architecture up-front (top-down), so that possible **integration problems** among components are **discovered and fixed early**
- It facilitates **reuse of SW components** across **different applications and different ECUs**
- It increases the **scope and amount of automatic code generation**, from Application components only to interconnection generation, operating system, communication and basic SW configuration
- It increases the **scope of simulation** from Application components only to almost the entire ECU SW → **Virtual Verification**

■ AUTOSAR Software Component:

- Runnables
 - ▲ Event Triggers
- Sender / Receiver Ports
 - ▲ Inputs/Outputs
- Variant Management
- Client / Server communication

- Internal Behaviour (Control logic)
 - Application of modeling rules

- Usage of FCA Custom Block Library and Simulink Data Dictionary
 - ▲ Test Point (linked to Data Dictionary)

Name	Status	Value	DataType	Min	Max	Dimensions	Unit	StorageClass
TemperatureTestPoint	Mod		single	0	90	[1 1]	Deg	FCALocalSignal (Custom)

- ▲ Calibration (linked to Data Dictionary)

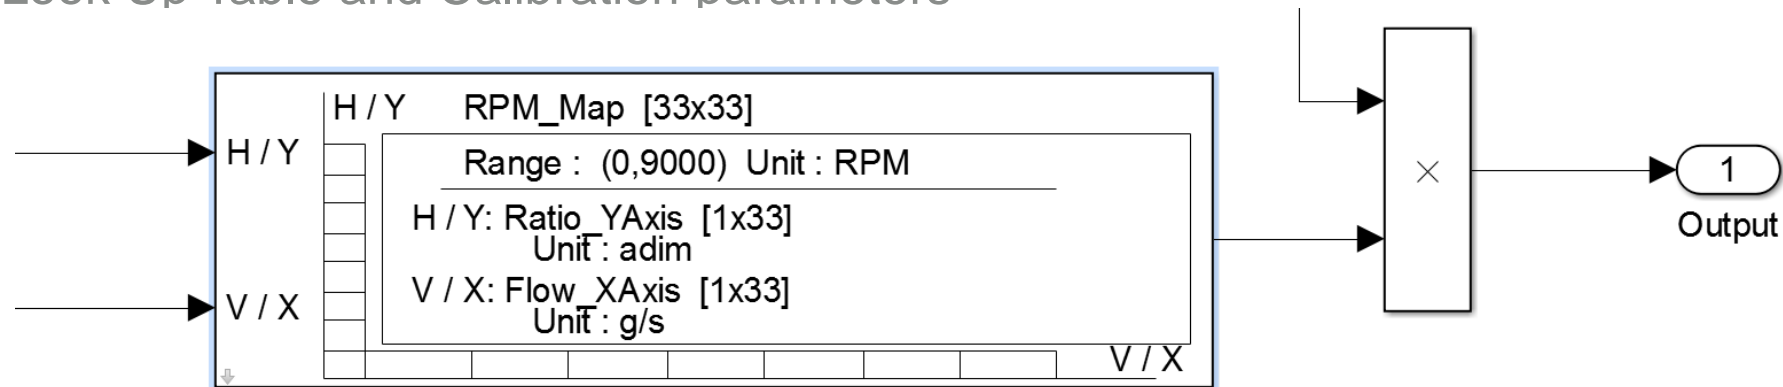

Name	Status	Value	DataType	Min	Max	Dimensions	Unit	StorageClass
RateCalib	Mod	8	single	0	255	[1 1]	adim	FCALocalParameter (Custom)

- Internal Behaviour (Control logic)

- Access to AUTOSAR server function through «function caller» block

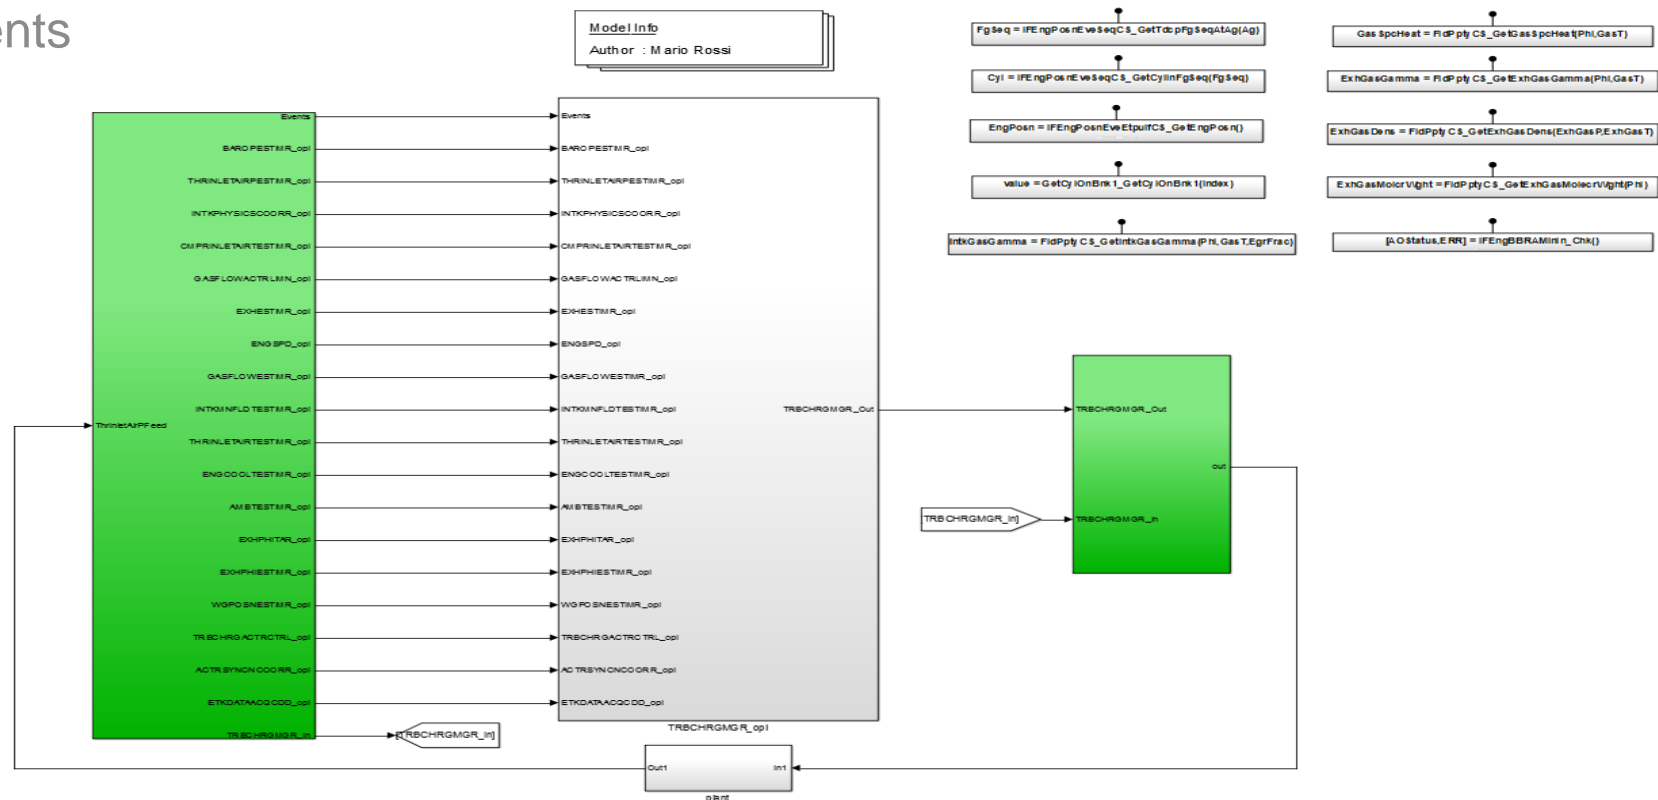

- Look Up Table and Calibration parameters

- An «Harness» Model is required to simulate the Control logics

The «harness» contains:

- Link to referenced model (Autosar Sw-Component)
- AUTOSAR Servers (Simulink functions)
- Inputs and Events
- Outputs

- Model vs Code verification through simulation with Simulink Data Inspector
 - MIL vs SIL comparisons
 - Documentation report

- Model Coverage is computed to ensure the model has been extensively tested

■ Code Generation

- A specific model configuration is used
- Only for referenced model (AUTOSAR Sw-C)
- Floating point, ANSI C code
 - ▲ Only counters and boolean variables in fixed point
- Deliverables : Source code (.c / .h) + .arxml

■ Software Integration

- Application SW + BSW + RTE (automatically generated)

■ SW Configuration and Version management

- RTC (IBM) is used for workflow instantiation, change management and SW repository
- 200+ Sw-C's (Simulink models, generated code, test reports, documentation...)
- Basic Software (BSW)
- Custom tools and libraries

- Model-based design and auto-code generation
- **Challenges in R2016a**
- Conclusions and next steps

Given to the **complexity** and **number** of models, a close **collaboration** between FCA and MathWorks is necessary to tailor the tool-chain to specific FCA **requirements** and to address tool-chain **improvements**.

Some examples of **expected functionalities** not present in 2016a:

- logging internal signals in SIL;
- support to AUTOSAR Data Type Record across referenced models;
- mature support of AUTOSAR Variants;

A **weekly meeting** occurs to communicate issues and new requests from FCA to MathWorks:

- issues are reproduced and analyzed, **workarounds** or **patches** are provided in the AUTOSAR Support Package;
- new **requirements** are collected, submitted to Mathworks developers and released in the new MATLAB releases (2018a provides the above functionalities).

- Model-based design and auto-code generation
- Challenges in R2016a
- **Conclusions and next steps**

- FCA Global Powertrain has embraced **AUTOSAR** and **model-based design** to build the **foundation** of next generation Control Systems
- Adoption of AUTOSAR enables the design of **complex and re-usable** SW applications, developed by **geographically distributed** teams
- Model-based design enables the development of **high quality code**, AUTOSAR compliant, through graphical design, simulation and code generation
- FCA Global Powertrain is further leveraging the AUTOSAR tool-driven approach to building **Virtual ECU**'s for early verification and calibration of **entire ECU production SW** in a Desktop PC environment
